

# Cyber Threat Assessment Program

## Get the Facts About your Network Security

### Know your Vulnerabilities with a Cyber Threat Assessment

Secure network architectures need to constantly evolve to keep up with the latest advanced persistent threats. There are two ways to find out if your solution isn't keeping up—wait for a breach to happen or run validation tests.

A **Fortinet Cyber Threat Assessment Programme (CTAP)** can help you better understand:

- **Security Risk** – which application vulnerabilities are being used to attack your network, which malware/botnets were detected, what phishing attacks are making it through your defenses and which devices are “at risk”— for security breach probability.
- **Productivity** – which peer-to-peer, social media, instant messaging, and other apps are running—for application visibility control as well as what spam, newsletters or adult content may be bothering your email.
- **Utilisation and Performance** – what is your throughput, session, and bandwidth usage requirements during peak hours—for the network, email system and critical applications.

### What is a CTAP?

Fortinet's Cyber Threat Assessment will validate your network's current security accuracy, analyse application traffic, assess user productivity, and monitor network performance - all at no cost to your organization. A Fortinet expert will deploy a FortiGate high-performance next generation firewall to monitor key indicators within your network, and 5-7 days later you will be presented with a comprehensive report that speaks to your organization's network security posture. Easy deployment, but with powerful results.

#### CTAP Snapshot:

- **Quick:** Less than 7 days of monitoring
- **Easy:** No interruption to your infrastructure
- **Comprehensive:** Security, productivity, and performance
- **No cost**
